

Capturing Customer Transactions...

Intelligent ATM Transaction Monitoring Solution

i-Cam is an ATM transaction monitoring solution, which enables financial institutions to capture, store and manipulate images of ATM customers while they transact. It captures snapshots of ATM users corresponding to events such as card insertion, card ejection and cash dispensing. These events may easily be changed according to the financial institutions' needs.

The images captured from ATM machines are then transferred to a central server via FTP. A GUI based viewer application can be installed for viewing and searching the image files based on various search criteria such as date, time, and location of ATM etc.

How will it work?

i-Cam Terminal Agent

This is a separate executable that runs on the ATM along with Application Core and Customization Layer. This executable hooks to the ATM resources and triggers events on which the pictures are taken.

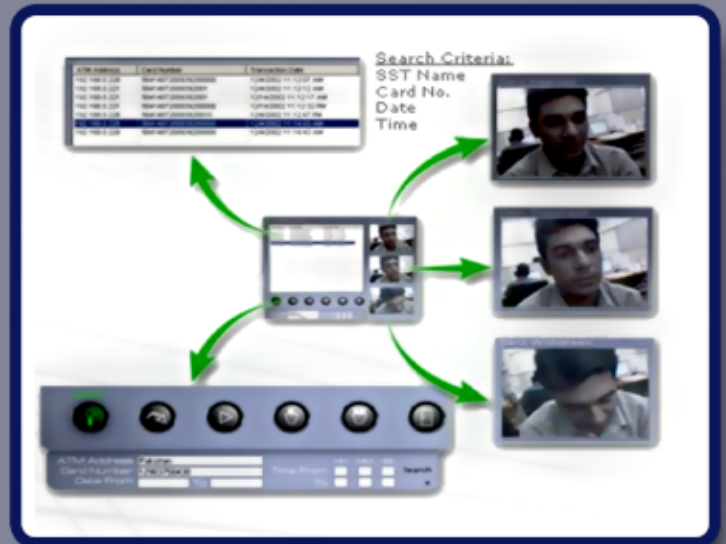

i-Cam Viewer Application

A GUI based application is used to view all the pictures, taken at the ATM during transactions. The i-Cam viewer monitors all the incoming pictures automatically and updates them. The pictures can be searched, based on multiple search criteria. The viewer application can be installed at more than one location, allowing decentralized and remote viewing for transaction monitoring.

Features

- Transaction based snaps using 2 Digital Cameras
- Central Archiving or Distributed Storage of images
- Low Network Load with JPEG Images
- Non Intrusive and Rapid Deployment
- Scheduler to transfer images at selected time
- Rotation of Captured Images
- Works with any industry using Standard USB Port
- Supports Windows NT, XP and 2000

Benefits

- ATM and Consumer Security
- Fraud Protection and reduced ATM Fraud Liability
- Surveillance and Customer Convenience
- No Management Overhead for archiving and uploading images
- Easy to manage surveillance for large ATM network
- Low Network Bandwidth with JPEG Images, 25k per transaction per ATM
